

A few bash commands

cd path/to/directory	change directory
cp origin.file destination.file	copies origin.file to destination.file
.	current working directory
..	previous directory
cd ../	enter previous directory
cd ../../path/to/directory	you can combine .. with cd to navigate different directories
mv origin.file destination.file	moves origin.file to destination.file (origin.file is deleted)
rm file.file	remove file
rm -r directory	remove directory and all files in it
grep text file.file	prints out all lines in file.file that contain the string text ; is case sensitive (cares about capitalization)
grep "text with space" file.file	quotation marks needed if there are spaces or special characters in the string you want to print
grep -i text file.file	this makes it not be case sensitive (all else equal)
grep -A n text file.file	prints out all lines with string text and <i>n</i> lines after
pwd	print working directory, prints path to current working directory
ls	list out files and directories inside current directory
mkdir directory	make directory
less file.file	open file and just view (no editing)
clear	clears the terminal
ctrl + c (cmnd + c on mac)	stops whatever is currently running
ctrl + c / ctrl + v (cmnd on mac)	may not work in the terminal , press ctrl + shift + c/v to copy/paste
nano file.file ctrl + o (cmnd + o on mac) ctrl + x (cmnd + x on mac)	open and edit text file to write to exit (nano will ask if you want to save changes)
